Works with all your existing tubing, hoses, mats and accessories from Drieaz F211-BU Driforce Inter Air Drying System Base Unit

Works with all your existing tubing, hoses, mats and accessories from Drieaz F211 Driforce Inter Air Drying System

Tips:

1. When removing baseboard, score top edge with blade. Always place a large putty knife or sheet rock mud applicator on the wall to help prevent the pry bar from leaving dents in the soft wet wall. Once baseboard is removed, from the back side, take channel lock piers and grab the nails and pull / roll the nail all the way through the wood. Mark both the lower wall and back baseboard with a number/letter with permanent marker. Lay paint side down. Determine if you want to drill 1/2" holes, 3/8" holes, or 1/4" holes into the wet surface depending on the accessories at hand every 16" apart below the cove base/base board top edge but above the sill plate stud. Drill a 1/16" hole near the ceiling every 16" to let the water vapor out of the wall cavity. Once the area is dry you simply re-attach the baseboard/cove base. Caulk the top of the baseboards, caulk the nail marks caused by affixing the baseboard to the wall, as well as the 1/16" top vent hole. Paint as needed.

2. The in and outbound air hose connection is 2" barbed so it already works with all the Drieaz branded accessories but the Injectidry uses 1-1/2" barbed connection you might need to consider an AH46 expanded hose cuff. These enlarger cuffs screw over the outside of 1.5" ID vacuum hose and enlarge to slip over 2" barbed connections.
